

Declaring Variables

```
public class ClassName {  
    public static void main(String args[])  
    {  
        // declare your variable name and its type  
        variableType variableName;  
  
        /* declare your variable name, its type and initialize it to a specific  
value */  
        variableType variableName = initialValue;  
  
        // if your variable is a string, it must be enclosed in double quotes  
        String variableName = "initialValue";  
  
        // print your variable  
        System.out.println( variableName );  
    }  
}
```
